AFS* to NFS Migration

Global Data Sharing at Intel

Travis V Broughton

Senior Systems Programmer

Intel Corporation

Intel's Engineering Environment

- ~80% NFS, ~15% AFS*, ~5% CIFS
 - ~30 AFS cells managed by ~30 loosely-connected IT organizations
 - AFS used for CAD and /usr/local applications, global data sharing for projects, secure access to data
 - NFS used for everything else, gives higher performance in most cases
 - Wide range of client platforms, OSs, etc

* Other names and brands may be claimed as the property of others

Things AFS* Does Well

- **Security**
 - Uses Kerberos, doesn't have to trust client
 - Uses ACLs, better granularity
- **Performance for frequently-used files**
 - e.g. /usr/local/bin/perl
- **High availability for RO data**
- **Storage virtualization**
- **Global, delegated namespace**

*Other names and brands may be claimed as the property of others

Things AFS* Doesn't Do Well

- Performance on seldom-used files
- High availability for RW data
- Scalability with SMP systems
- Integration with OS
- File/volume size limitations

* Other names and brands may be claimed as the property of others

AFS* Usage at Intel: Global Data Sharing

- **Optimal use of compute resources**
 - Batch jobs launched from site x may land at site y, depending on demand
- **Optimal use of headcount resources**
 - A project based at site x may “borrow” idle headcount from site y without relocation
- **Optimal license sharing**
 - A project based at site x may borrow idle software licenses (assuming contract allows “WAN” licensing)
- **Efficient IP reuse**
 - A project based at site x may require access to the most recent version of another project being developed at site y

AFS* Usage at Intel: Other Applications

- **x-site tool consistency**
 - Before rsync was widely deployed and SSH-tunneled, used AFS namespace to keep tools in sync
- **@sys simplifies multiplatform support**
 - Environment variables, automounter macros are reasonable workarounds
- **/usr/local, CAD tool storage**
 - Cache manager outperforms NFS
 - Replication provides many levels of fault-tolerance

Global Filesystem Requirements

- **Platform Independence**
 - Client interoperability is a must
 - Choice of server platforms also desirable
- **Global namespace**
- **Strong authentication/authorization**
- **WAN-friendly**

* Other names and brands may be claimed as the property of others

E**

Global Filesystem “nice-to-have”s

- **Suitable for local data**
 - HA capabilities
 - High performance for “hot” files
 - Replication with consistency assurance
- **Data location independence**
 - Data migration for performance, space, maintenance, etc.

* Other names and brands may be claimed as the property of others

Global Filesystem “nice-to-have”s

- Flexible quotas
- Filesystem encryption
 - Transport layer?
 - On-disk?

* Other names and brands may be claimed as the property of others

AFS* is going away, now what?

- **OpenAFS***?
 - Same issues as AFS, mostly
- **NFSv3?**
 - Not secure enough for global data sharing
 - NFSv3+Kerb not supported on all platforms
- **Caching NFS proxy solutions?**
 - Somewhat cumbersome to use globally
 - Security?
 - Possibly a point solution
- **NFSv4?**
 - Looks promising, concerned about roadmaps

* Other names and brands may be claimed as the property of others

C
E**

NFSv4 Opportunities

- **Single filesystem for all data**
 - No longer have to ask “AFS* or NFS”
- **WAN performance improvements**
 - Probably better than AFS, even w/o cachefs
- **HA via clustering should just work**
- **Filesystem tested and released by OS vendors**
- **NAS cost-effectiveness**

* Other names and brands may be claimed as the property of others

E**

NFSv4 Challenges

- Integration of lots of enabling technologies
 - Automounter
 - autofs or am-utils for clients?
 - LDAP, NIS, etc for map storage?
 - Security
 - Kerberos KDC (MIT? Heimdal? Active Directory*?)
 - Different ACL flavors on different servers?
 - Group management? Global groups?
- Support for legacy client platforms
 - Access for clients without native NFSv4
- Optional features and/or “enhancements”
 - e.g. cachefs

*Other names and brands may be claimed as the property of others

**N I C

Y N
C
E**

NFSv4 Challenges

- **Global namespace management**
 - Delegate portions of namespace to different IT orgs
- **New security model**
 - New authentication mechanisms
- **User and group consistency**
- **Timeline for client availability vs. IBM's AFS* EOL schedule**

* Other names and brands may be claimed as the property of others

**N I C
F N O
S D N
U S F
T R E
R Y N
C E**

Conclusions

- AFS* EOL will require changes
- NFSv4 looks like a good fit for global data sharing
- AFS to NFS migration non-trivial
 - Enabling technologies and tools needed

* Other names and brands may be claimed as the property of others
